

- 235 Chimor irrigation and canal: Denevan 2001:152-57. Some scholars attribute the uphill sections to tectonic uplift; Denevan finds the regularity of the error difficult to reconcile with tectonic causes (156).
- 235 Layout of Chan Chan: Shimada 2000:esp. 102; Moseley 1975a.
- 235 Fall of Chimor and execution of Qhapaq Yupanki: Sarmiento de Gamboa 2000:102-03; Rowe 1946:206.
- 236 Chimor and Thupa Inka: Rostworowski de Diez Canseco 1999:72-73, 77-79; Sarmiento de Gamboa 2000:102-03, 112-15.
- 238 Nazca lines: The original report, which I have not seen, is Mejía Xesspe 1940. Von Däniken's claims are found in, among many other titles, Von Däniken 1969, 1998. Calendrical and astronomical theories are (to my mind) convincingly dismissed in Morrison and Hawkins 1978. The best explanation I know of the current geology-and-water hypothesis is Aveni 2000. For a variant, see Proulx, Johnson, and Mabree 2001.
- 239 Moche: Bawden 1996; Uceda and Mujica eds. 1993. Research on the Moche was greatly stimulated by the discovery of relatively untouched, art-filled tombs in Sipán in 1987. (Accounts of the efforts by Peruvian archaeologist Walter Alva to save the site's artifacts from looters, include Kirkpatrick 1992 and Atwood 2004.) Since Sipán, much research on the Moche has focused on their art—understandably so, given its high quality (e.g., Alva and Donnan 1993).
- 240 Chavín de Huantar: Author's visit; Burger 1992; Lumbreras, González, and Lietzner 1976 (roaring sounds); Lumbreras 1989; Rowe 1967.
- 8 / *Made in America*
- 243 Chak Tok Ich'aak's life and death: Stuart 2000; Schele and Mathews 1998:75-79; Martin and Grube 2000:28-29 (portrait reproduced on 28, "entered the water," 29); Harrison 1999:71-81. See also Stone 1989.
- 244 The four cities are Palenque (Martin and Grube 2000:156), La Sufricaya (Estrada-Belli 2002), El Perú and Uxactun (Martin and Grube 2000:28-29).
- 246 "No words": Webster 2002:7.
- 246 Morley's theory: Morley 1946:262. The earliest version of the ecological-overshoot theory I know of is Cooke 1931. Cooke claimed that overexpansion of agriculture had caused erosion that filled up Maya water reservoirs.
- 246 Pollen studies: Vaughan, Deevey, and Garrett-Jones 1985; Deevey et al. 1979.
- 246 Environmental degradation, deforestation, floods: Binford et al. 1987; Abrams and Rue 1988; Woods 2003. I am grateful to Prof. Woods for sending me a copy of his article.
- 246 Deforestation-induced spiral to collapse: Santley, Killon, and Lycett 1986.
- 246 Drought: Curtis and Hodell 1996 ("Our findings suggest a strong relationship between times of drought and major cultural discontinuities in Classic Maya civilization," 46). See also, Hodell, Curtis, and Brenner 1995.
- 246 Green parable: See, e.g., Catton 1982; Lowe 1985; Lutz 2000 ("Environmentalists concerned about the rapid growth of world population repeatedly cite the Maya collapse as an example of what happens if a region's population growth exceeds its population carrying capacity," vii); Ponting 1991 ("The clearest case of environmental collapse leading to the demise of a society comes from the Maya," 78); Diamond 2004: 157-77; Wright 2003: 94-106 (Maya collapse shows that "civilizations often behave like 'pyramid' sales schemes, thriving only when they grow," 83). Part of the appeal, one assumes, is that the Maya fall (like that of Cahokia, which I cover later) was not due to Europe.
- 247 "were able to," "Are contemporary": Ponting 1991:83; 1990:33.
- 247 Examples of spiritual books: Grim 2001; Berkes 1999; McGaa 1999; Durning 1992.

- 247 Five Great Values: Derived from Reiten 1995. Reiten, an administrator in a Bureau Indian Affairs school in New Mexico, gave her list to Tony Sanchez, of Oakland State University, who revised it to broaden the values' applicability from the Lakota to Indians—implicitly, and one assumes benevolently, asserting that all indigenous people thought alike, thus denying their intellectual and cultural diversity. I quote from Sanchez's revised version (Sanchez 2000:420-21).
- 248 Van der Donck: Shorto 2004; Van der Donck 1841 ("all free by nature," 207; "[I] remark," 210; "woods, plains and meadows," 150-51; "several hundred miles," 138).
- 248 "Such a fire": Van der Donck 1993:n.p. ("Of the Wood, the Natural Productions: Fruits of the Land"). I use this translation here because it is more evocative.
- 249 The following discussion of the natural role of fire draws from Mann and Plummer 1995:89-92; Mt. St. Helens from author's visits.
- 249 Nature not in lockstep: Borkin 1990; Pickett and Thompson 1978.
- 250 Ecological role of fire: Wright and Heinzelman 1973; Komarek 1965 ("The earth," 204).
- 250 Fire and landscape management: Pyne 1982:71-81 (Lewis and Clark, 71-72; Jefferson, Day 1953:334-39; Williams 1989:47-48; Williams 2002; Cronon 1983:48-52; Mori 1937:52-54 ("to set fire," 52). The impact of fire varied; in Martha's Vineyard, for instance it seems to have been negligible (Foster et al. 2002).
- 251 Carriages in Ohio: Bakeless 1961:314, cited in Denevan 1992a:369.
- 251 "could be": Wroth ed. 1970:139. See also, Higginson 1792: 117-18 (reporting "thousand acres of ground as good as need to be, and not a tree in the same").
- 251 Smith's gallop: Smith 1910 (vol. 1):64. He also saw Indians hunting with fire (70).
- 251 Bison range: Roe 1951; Mathiessen 1987:147-52; Cronon 1983: 51-52 ("were harvesting").
- 251 Impact of Native American burning: Pyne 1982:71-83; Little 1974; Dorney and Dorr 1989; Delcourt et al. 1986; Rostlund 1957a, 1957b.
- 251 Great Plains and anthropogenic fire: Axelrod 1985; Steuter 1991; Sauer 1975; Willis 1989:46-48; Lott 2002:86-88 ("When Lewis and Clark," 88).
- 251 Fidler's fires: Fidler 1992 ("Grass all," "Not a," "All burnt," "the grass," 13-15; "The Grass 36," "very dangerous," 59).
- 252 Return of forest to Midwest: Williams 1989:46 (Wisconsin, Illinois, Kansas, Nebraska; Fisher, Jenkins, and Fisher 1987 (Wyoming); author's visit, Texas (displays of historical photographs).
- 252 "disastrous habit": Palliser 1983:30.
- 252 Raup: Raup 1937 ("have been," 84; "inconceivable," 85).
- 252 "It is at least": Brown and Davis 1973:116, quoted in Williams 2002:183.
- 252 Vale: Vale 2002 ("modest," 14); 1998. Vale was rebutted in Keeley 2002. An example how natural scientists continue to dismiss the human presence is Hillsborough, Whitlock and Bartlein 2000 (examining long-term fire frequency at Yellowstone National Park, area inhabited for thousands of years, "offers a natural 'experiment' that allows us consider the sensitivity of fire regimes to climate change alone," 211 [emphasis added]).
- 252 Cahokia description: Author's visit; author's interviews, Woods; Dalan et al. 2003:64-7.
- 253 Biggest population concentration: Iseninger 1997, cited in Woods 2004:152.
- 253 Controversy over mound origins: Silverberg 1968 (Bancroft, 98); Gallinghouse 2004; Kennedy 1994:230-39; Jefferson 1894:query XI (excavation of "barrow").
- 254 Quachita mounds: Saunders 1997; Pringle 1997 ("I know it," 1762). The mounds longer overlook the river, which has changed its course since their construction.
- 256 Origins and rise of eastern North American agriculture: Smith 1993 ("the indigenous crops in question," 14), 1989. See the similar early argument in Linton 1924:349.
- 256 Eastern Agricultural Complex: More formally, the Eastern Agricultural Complex consists of squash (*Cucurbita pepo*); marshelder or sumpweed (*Iva annua*); erect knotweed
